USSR/Chemistry - Lithium Salts;
Cobalt Salts

"Mutual System Composed of the Sulfates and Chlorides of Lithium and Cobalt," D.S. Lesnykh, A.G. Bergman, Rostov-on-Don State U im V.M. Molotov

Zhur Osnch Khim, Vol 23, No 6, pp 894-901

Investigated the thermochemical relationships in the mutual ternary system composed of the salts $\text{Li}_2\text{Cl}_2 + \text{CoSO}_4 + \text{Li}_2\text{SO}_4$. Found that this system consists of 2 ternary systems: $\text{CoCl}_2\text{-Li}_2\text{SO}_4$ -

273T24

Li_2Cl_2 with a triple eutectic point at 452° and $\text{CoCl}_2\text{-Li}_2\text{SO}_4\text{-CoSO}_4$ with a triple eutectic point at 507° .

Title : On The Problem Concerning Stratification in Fused Chlorides and Sulfates of Monovalent and Bivalent Metals

Orig Pub: Uch. zap. Rost. n/D un-ta, 1954, t. 20. Trudy khim. fak.,
vyp. 6, 19-31

Abstract: The liquidus graphs of the irreversible reciprocal system Li, Pb // Cl, SO₄ and of the diagonal sections of the systems Li, Cd // Cl, SO₄; Li, Ag // Cl, SO₄, Li, Ca, Cl // Cl, SO₄ and Li, Sr // Cl, SO₄ were studied by the visual-polythermal method. Based on the obtained data, as well as on data found in the bibliography, the conclusion was arrived at that the stratification in the melted state takes place mainly in systems containing cations with an 8-electron or 2-electron exterior layer,

Title : Reciprocal Ternary System of Lithium and Manganese Sulfates and Chlorides

Orig Pub: Uch. zap. Rostovsk. n/D un-ta, 1955, 25, vyp. 7, 19-23

Abstract: The irreversible system of Li, Mn // Cl and SO₄ was studied by the visual-polythermal method. The crystallization field of MnCl₂.2LiCl is of a triangular shape and ends at a point of double ascent. The crest line in the crystallization field of MnCl₂ is shifted by about 2.5 percent away from the diagonal MnCl₂-Li₂SO₄ towards MnSO₄, which indicates some reversibility in the system at melting points.

Title : Stratification in fusions of mutual systems with participation of salts
of first and second groups

Periodical : Dok. AN SSSR 103/2, 261-263, Jul 11, 1955

Abstract : Experiments conducted with Na, Cs, Li and other metal systems showed that one of the conditions leading to stratification during the fusion of these elements is the greater difference in the polarizability of the cations and anions of the components. The most vivid difference in the polarizability was established among ions with 8 or 2 external electron layers and ions with external electron structure consisting of 18 or 18 plus 2 electrons. The effect of fluorides on the prevention of stratification in liquid phases is explained. Nine USSR references (1929-1946). Graphs.

Title : Mutual System of Lithium and Silver Chlorides and Tungstate
with Stratification.

Orig Pub : Zh. obshch. khimii, 1956, 26, No 6, 1560-1564

Abstract : The liquidus surface of the ternary mutual system Ag, Li //
 WO_4 , Cl was studied by the visual-polythermal method. The
eutectic points of the binary systems Li_2WO_4 - Ag_2WO_4 and
 Ag_2WO_4 - Ag_2Cl_2 are at (in equ.%) 55% of Ag_2WO_4 and 560°
and at 70.0% of Ag_2Cl_2 and 390° respectively. The crystal-
lization surface of the mutual system is represented by
crystallization fields of AgCl , Ag_2WO_4 , Li_2WO_4 and solid
solutions (Li, Ag) Cl. The ternary eutectic points answer
375°. There is a great region of stratification situated
above the Li_2WO_4 field and occupying 63.51% of the area of the
square of composition. The diagonal sections Ag_2MoO_4 - Li_2WO_4
with the transition point at 450° and 37.5% of Li_2WO_4 , and Li_2

LESNYKH, D. S.

Mutual solubility of some lithium and silver salts in the fused state. D. S. Lesnykh and A. G. Bergman (V. M. Molotov State University, Kirov-on-Dva). Zhur. Fiz. Khim. 30, 1959-65 (1956).—Reciprocal Ag and Li chloride and chromate systems form no complexes, with the equil. strongly displaced towards the AgCl and Li₂CrO₄, and the mutual limited solv. of the stable couple in the fused state. When Cl⁻ in the Li and Ag chloride-chromate system is replaced with SO₄²⁻, WO₄²⁻, and MoO₄²⁻, AgCrO₄ occupies the place of AgCl in the first system discussed. Conclusions are drawn that the polarizability of CrO₄²⁻ is intermediate between Cl⁻ and SO₄²⁻, and that the polarizability decreases in the order CrO₄²⁻ → MoO₄²⁻ → WO₄²⁻ → SO₄²⁻. The layer formation in the Li, Ag systems with Cl⁻, SO₄²⁻; Cl⁻, WO₄²⁻, Cl⁻, MoO₄²⁻, and Cl⁻, CrO₄²⁻ occur at 62.5, 63.61, 57.32, and 25.78% of the square of the compn. of all reciprocal systems, i.e., the difference in the ionic polarizability with a high polarizability difference of the cations in the fused salt mixts. is one of the conditions for the layer formation in such fused systems.

Perebyalye Storkotsi detskayi moshch /u i Tikhonovskiy/. Abotnik
stoy (Increasing the Wear Resistance of Machine Parts). Sovnauk-
izdat (Collection of Articles). Moscow, 1959.
126 p. Bratya slip printed. 4,500 copies printed.

Ed. M. (Title page). M. M. Barabashov, Doctor of Technical Sciences;
M. A. Kostylev, Candidate of Technical Sciences; V. D.
El'kin, Manager, Ed. For Literature on General Technical and
Transport Machine Building (Material). L.A. Ponomareva, Engineer.

PURPOSE: This collection of articles is intended for engineering
and technical workers of machine-building and overhauling plants.
COVERAGE: This book presents results of investigations of methods
to increase the resistance of machine parts to seizure. A new
method of sulfurization which improves the friction behavior of
cast iron and steel and an analysis of the effect of sulfuriza-
tion on the anti-friction properties and wear of metal are given.
These articles are the transactions of a seminar held at the
Institute of Mechanical Engineering of the Academy of Sciences,
USSR, in December 1958.

TABLE OF CONTENTS:

✓ Stevt, R.S., Engineer. Results of Work on the Technology of
the Sulfurization Process in Birobidzhan, Zabaykalsk-Donu
Agricultural Machinery Plant. 111
The author describes an investigation carried out at the
Birov plant aimed at improving wear resistance of cutting
tools by sulfurization.

✓ Lifshits, Ya. G., Candidate of Technical Sciences. Use of
Sulfurization in Manufacturing Agricultural Machinery. 115
In this article the author presents the results of lab-
oratory and bench tests of sulfurized and unsulfurized
machines parts carried out by BISKh (Birov Institute for
Agricultural Machinery) and BOSTSEZ (Birov Institute for
Sulfurization).

✓ Stolchin, N.I., F.S. Nesternko, and K.T. Shuvayev. X-ray and
Spectroscopic Analysis of Sulfurized Samples. 121
The author describes an investigation of depth distribution
of sulfur in type 65 steel and gray cast iron sulfurized at
the BOSTSEZ (Birov Institute for Sulfurization).

✓ Lashkikh, D.S., Candidate of Chemical Sciences. Electrother-
mal
The author presents the results obtained from sulfurizing
parts in various molten salts at 260 to 270°C and in
aqueous solution of salt and 50 to 75°C using electrolytic
methods.

TITLE: An electrochemical method of metal sulfonation

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 12, 1962, 131 - 132,
abstract 121808 ("Uch. zap. Rostovsk.-n/D. un-ta", 1959, v. 60,
151 - 172)

TEXT: The authors studied the effect of factors upon the quality of a forming surface layer in the electrochemical method of cast-iron and steel sulfonation. These factors are: bath composition; metal type used for the cathode specimen (part) prior to sulfonation; current density on the anode; bath temperature; duration of the process and throwing power of the bath. Aqueous solutions and melts of sulfur-containing salts were used as sulfonation baths, e.g. CH_3COOK 50%, CH_3COONa 30%, $\text{Na}_2\text{S}_2\text{O}_3$ 10% and KCNS 10% with an operational temperature of the melt as high as 260 - 240°C, and a 10% aqueous solution of $\text{Na}_2\text{S}_2\text{O}_3$ and KCNS in a 5 to 2 ratio; the sulfonation temperature is 50 - 75°C. To obtain a strong and elastic sulfonated layer, the specimens were

A high-power pulsed oscillator

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,
Radiotekhnika, v. 4, no. 6, 1961, 726 - 728

TEXT: Generation of high-power bursts of ultrashort-wave frequencies is of importance in linear accelerators of heavy particles. A pulsed oscillator based on the triode, type ГЛ-4А (GI-4A), was therefore developed. Constructionally, the oscillator is based on coaxial tuned circuits, in which the tube operates as a grounded-grid system (Ref. 1 - M.S. Neyman - Triode and tetrode generators for UHF (Triodnyye i tetrodnyye generatory SVCh), Sovetskoye radio, 1950). The anode-grid resonant circuit is in the form of a quarter-wave line, terminated with the interelectrode capacitance Cag (Fig. 1). Since the external diameter D = 33 cm, internal diameter d = 14 cm and Cag = 35 pF, the resonance frequency is 142 Mc/s and the length h of the anode grid-tuned circuit is 19 cm;
Card 1/3

A high-temperature

S/142/61/004/006/015/017
E192/E582

these calculated data were verified experimentally. The cathode-grid circuit is in the form of a short-circuited polycylindrical coaxial section of a half-wave line; this is terminated with the capacitance C_{ag} . The feedback is provided by three non-adjustable loops positioned at angles of 120° with respect to each other, in such a manner that the loops pass through the common wall of the resonators. The separator condenser in the anod-grid circuit consists of six groups of condensers, each consisting of two condensers in series. The oscillator was tested with an $82-\Omega$ resistive load, which was in the form of a polystyrol cylinder with a water solution of sodium carbonate. It was possible to obtain a maximum power of 1.2 MW with an anode voltage of 52 kV and pulse duration of 450 μ s. The oscillator was also tested with a high-Q load formed by the resonator of a linear proton accelerator; this had a resonance frequency of 142 Mc/s and a quality factor of 50 000. It was found that at an anode voltage of 36 kV the resonator of the accelerator received a power of the order of 500 kW, so that the protons could be accelerated up to energies

Production of honeycomb structures ("Proizvodstvo sotovykh konstruktsiy")
Moscow, Izd-vo "Mashinostroyeniye," 1966, 281 p. illus., biblio.
Errata slip inserted. 3700 copies printed.

TOPIC TAGS: honeycomb structure, honeycomb filler, honeycomb structure
manufacturing, honeycomb filler manufacturing, filler nonmetallic
material, aluminum alloy, titanium alloy, stainless steel

PURPOSE AND COVERAGE: This book is intended for engineers-designers
and technologists in various branches of the machine-building
industry. It may also be useful to teachers and senior students of
schools of higher education specializing in machine building. The
book deals with problems connected with designing and manufacturing
glued and brazed structures containing honeycomb fillers, the use of
which in aviation, automobile, shipbuilding and construction
industries is rapidly growing. Data on designs and strength of

parts with honeycomb fillers made of nonmetallic materials, aluminum and titanium alloys or stainless steel are presented. Methods of making honeycomb fillers and structures having honeycomb fillers are described as well as equipment and instruments used for mechanization and automation of manufacturing and control of honeycomb fillers and parts containing them. Chapters I, II, and III were written by Engineer V. N. Krysin, and Chapters IV, V and VI by Candidate of technical sciences B. E. Bersudskiy and Engineer S. I. Lesnykh.

Converting gypsum into cement and sulfur. A. F. Pavlov, I. G. Lesokhin and D. G. Fraber. *J. Chem. Ind.* U.S.S.R. 113, No. 3, 5 (1980). When a mixt. of gypsum, clay and coal is heated in a rotary furnace at 1,000-1,100°, it gives off 98.0% of its S as SO₂ and H₂S. These pass into a cooler zone at 600-700° and deposit 85.0% of their S as the free element. The residual clinkers satisfy the standards for cement. H. M. L.

kinetics of the formation of calcium aluminates and the rate of mineralization. V. P. Zharov, I. U. Lomakina, and N. G. Tsvetkov. Zhur. Priklad. Khim. (J. Appl. Chem.) 21, 807-802 (1948).--(1) Mixts. of finely ground CaCO₃ and Al₂O₃, intimately mixed and pressed, in the mol. ratio CaO:Al₂O₃ = 1:1 and 3:1, were heated at temps. 800-1300° for 30, 60, 120, and 180 min., and the progress of formation of Ca aluminate was measured by anal. data of unheated CaO. In the 1:1 mixt., blending of CaO begins in its nepheline at 800°, with the result, of 2% (by wt.) of CaAl₂O₄ at 900°. In the 3:1 mixt., it begins at 900°, and, with 2% CaAl₂O₄ at 1100°. The rate of blending is greatest in the initial stages (approx. the 1st hr.), then becomes slower, and, finally, comes to a halt. The rate increases with the temp., except in the case of the 1200° bathm. of 2:1 + 3% CaF₂, which lies below that of 1300°, and intersects the 1100°, and, later, probably also the 1000° bathm. This is consistent with Eitel's observation (C.A. 33, 42747) of the promotion of decomps. of 3CaO·Al₂O₃ by CaF₂. (2) Microscopic examn. showed that samples heated 100 min. at 1300° without CaF₂ contain 30-40% more 3CaO·Al₂O₃ than if heated with 3% CaF₂. Addn. of CaF₂ accelerates the formation of aluminate (blending of CaO) from 900° upward in the case of the 1:1 mixt., but only above 1100° for the 3:1 mixt. By microscopic and x-ray examn., the main products, in the 1:1 mixt., are Ca₂Al₂O₅ and 3CaO·2Al₂O₃. The former begins to be formed at as low as 800°, and its abs. and relative amt. increases with the temp.; the latter begins to be formed at 900°, and, with increasing temp., its abs. amt. increases but its relative amt. decreases.

ASS-5A METALLURGICAL LITERATURE CLASSIFICATION

3CaO·Al₂O₃ appears over the whole temp. range in the form of isolated grains; 0.8 Ca₂Al₂O₅ appears, in the same form, between 900° and 1100°. The nature and the relative amt. of the minerals produced do not vary with the length of the heating or in the presence of CaF₂. In the 2:1 mixt., the amt. of CaO·Al₂O₃ increases with the temp., but it increases also with the length of the heating, and in the presence of CaF₂. The abs. amt. of 3CaO·Al₂O₃ increases with the temp.; at 900°, it predominates markedly over Ca₂Al₂O₅, but, from 900° on, its relative amt. decreases. Significant amts. of 3CaO·Al₂O₃ are formed only from 1200° up; CaF₂ lowers both its temp. of formation and its temp. of decomps. (3) Jander's kinetic equation (C.A. 22, 1818), which does not take into account the change of the concn. of the reactants during the reaction, is not applicable to the exptl. data. Much better agreement is found if the change of concn. is taken into account, which leads to the differential kinetic equation $dy/dt = b^2 D/(100 - y)/r$, where y = thickness of the reaction layer at the time t , D = diffusion coeff., and x = percentage conversion at the time t . In terms of the radius r of the grains of the solid reactants, the integrated form of becomes $(\sqrt{(100/(100 - x))} - 1)^2 = 300 \cdot b t$, where $b = b^2 D/r^2$. In contrast to rate const., defined by a definite order of reaction, and which do not fit the exptl. data, the const. b defined by this equation does not vary by more than 21% at a given temp. Examples of av. values of b (time in hrs.) are: 1:1 mixt., 100, 1000, 1000;

Influence of iron sulfates on vanadium catalyst in the production of contact sulfuric acid. L. G. Lenokhov, D. G. Traber, and I. P. Mukhamov (Leningrad Tekhnol. Inst.), *Zhur. Priklad. Khim.* (J. Applied Chem.) 23, 348-9 (1950).—Mech. deposition of FeSO_4 , up to 7%, on the catalyst causes some lowering of its activity only at 450° , none at 485 and 500° . The formation of rinds at points of contact of the catalyst with the heat-exchange pipes is due to condensation of H_2SO_4 which, at lower temps., dissolves the active components of the catalyst. At higher temps., H_2SO_4 evap., and leaves a solid rind of catalyst granules cemented by sulfates. If FeSO_4 or $\text{Fe}_2(\text{SO}_4)_3$ is incorporated into the catalyst at its prep..

Its activity is lowered proportionally to the Fe content. The poisoning coeff. a , defined by $a = (2.303/g) \log (b/b')$, where $g = \text{g. } \text{FeSO}_4$, l. catalyst, b and b' the reaction rate const. without and with Fe, is 0.003 at 450° and 0.010 at 485° .

Arsenic poisoning of vanadium catalysts in the production of sulfuric acid I. G. Resokhin and I. P. Mukhlemon (J. Applied Technol. Inst. Leningrad Polytech. Univ., J. Appl. Chem.) 23, 140-150 (1960). The effect of different amounts of As₂O₃ on the degree of oxidation of S₀ to S₆ was determined in S₀-3% air mixtures. Known amounts of As₂O₃ (dissolved in S₀) were mixed with known amounts of V₂O₅ (S.T.P.) as catalyst, showing at a space velocity of 185-200 hr⁻¹ (S.T.P.) a catalyst

loss of 45% and 60%. At any given c , the catalyst retains only a fraction, increasing with time, of the As₂O₃ passed until a saturation is reached. The plot of the rate const. k of the oxidation as a function of the amt. c of As₂O₃ retained (g./1. stdl. catalyst) consists of an initial rectilinear portion representable by $k = k_0 - \frac{c}{k_1}$, where the poisoning coeff. $k_0 = 0.2$ (in a mixt. contg. 70% S₀, 30% air, at 483°, $c = 0.5$ mg./l.). On further prolonged poisoning, disappearance of As₂O₃ by the catalyst decreases and stops at 11.12% As₂O₃ (the wt. of the stdl. catalyst, or 15% of the wt. of the unsat'd catalyst). Over that range, the rate const. can be represented by $k = \frac{k_1}{c} e^{-\frac{E}{RT}}$, i.e., the decrease of the rate is hyperbolic. The limit of poisoning is represented by $k = k_1 e^{-\frac{E}{RT}}$, where the subscripts '1' and '0' refer to the initial and final k , resp. The values of $(k_1/k_0)^{(483/440)}$, with respect to the stdl. catalyst, are $\omega = 0.0231$, 0.0180, 0.0185, 0.0182, 0.0179, and with respect to the unsat'd catalyst $\omega = 0.0292$, 0.0220, 0.0215, 0.0211, 0.0206. The activation energy E for the poisoned catalyst, in the temp. range 473-505°, is 29.22 kcal./mole, close to the figure (38.20 kcal./mole) for the unpoisoned catalyst. However, below 473°, E for the poisoned catalyst is increased by a factor of 2, whereas on an unpoisoned catalyst the same increase is observed only at as low as 440°. Catalysts poisoned with small amt. of As₂O₃ cannot be regenerated by an air blast at 450-550°, only the As₂O₃ retained at higher c and over longer times can be removed in a hot-air stream. With $c = 2.0$ mg./l. and 24 hrs., the total amt. of As₂O₃ retained consists of an irreversible and a reversible part. Under production conditions, c is usually low, and therefore the poisoning is mostly irreversible. More efficient is the removal of As₂O₃ (in the form of As₂O₅) by HCl; this operation, however, entails a loss of activity of the catalyst. Some elimination of the As₂O₃ is also achieved by H₂O vapor.

TITLE:

On the Problem of Obtaining Pyroreduced Iron Out of Pyrite
Cinders in a Suspended Layer (V v, posledovatel'noe issledovaniye
elektronnym uvelom. iz pirovannih cinderov vo vospeshennom
sloye)

PERIODICAL:

Zhurnal prikladnoy chimii, 1960, Nr 1, pp 26-30 (USSR)

ABSTRACT:

This is a study of the reducing process of iron out of pyrite cinders by various gaseous and solid reducing agents. The pyrite cinders were obtained in the process of roughing flotation pyrite in the mechanical furnace of the Leningradskiy Chemical Plant. They were reduced by a gaseous reducer (illuminating gas) in the suspended layer, i.e. when the layer of a solid material from the stationary (filtering) state passes over into the suspended state. As a result of this study, in which took part N.A. Shilova, it was established that: 1. The degree of iron reduction increases with a rise of temperature. The degree of reduction amounts to 61.5; 72 and 76% at temperatures of 700; 800 and 900°C respectively, under the same other conditions; 2. The degree of reduction depends on the chemical composition of the initial cinders. Preliminary sulfur removal increases somewhat this degree; 3. The reduction degree increases with the rise of the velocity of the reducing gas (under the same other conditions): at a velocity of 0.11 m/sec the degree

TITLE: Pyrolysis of straight-run low octane number gasoline to butylenes, divinyl and aromatic hydrocarbons

PERIODICAL: Khimicheskaya promyshlennost', no. 2, 1962, 4 - 6

TEXT: Gasoil from the Romashkino deposit (specific weight 0.730, mean molecular weight 105) was submitted to pyrolysis in a laboratory apparatus. The pyrogas was analyzed chromatographically with an λ_2 (KhPA-2) apparatus. Results: (1) The optimum butylene yield was obtained with 25% admixture of water vapor at 725°C and a contact duration of 0.5 - 1 sec, 7.0% 750°C and a contact duration of 0.5 - 1 sec were the optimum for high butadiene yield: olefin yield about 51%, butadiene content in the C_4 fraction 30.4%. (2) Aromatization took place under conditions under which a pyrogas rich in olefins developed simultaneously. No water vapor was added. (a) Single-stage process: At 750°C , contact duration 4.0 sec, 8.5% benzene related to the initial gasoline was obtained. The benzene fraction contained 95.0% C_6H_6 . At 750°C and contact duration ✓

Card 1/2

Pyrolysis of straight-run...

of 4 sec, 3.8% toluene (15% in the toluene fraction) was obtained. The yield was: 20% ethylene, 4% propylene, 2% butylenes, 1.5% divinyl. (b) Two-stage process: After a contact of 1 - 2 sec at 725 - 750°C, the high-boiling part of the pyrocondensate was further pyrolyzed at 650 - 680°C with a contact duration of 10 - 20 sec. At a contact duration of 1 sec in the first stage (750°C) and 14 sec in the second stage (680°C), the content of aromatic hydrocarbons increased from 60% to 93 - 96%. At a contact of 2 sec in the first stage (725°C) and 15 sec in the second stage (650°C), the content of aromatic hydrocarbons increased from 45% to 80 - 85%. The suitability of the two-stage process depends on whether the increased costs may be covered by savings from easier separation of the aromatic hydrocarbons. There are 3 figures, 3 tables, and 2 references: 1 Soviet and 1 non-Soviet.

TITLE: Preparation of lower olefines, divinyl and aromatic hydrocarbons by the pyrolysis of benzene fractions

PERIODICAL: Neftekhimiya, v.2, no.4, 1962, 495-497

TEXT: An investigation was made of the pyrolysis of straight-run benzene from Romashkino crude, boiling between 30 - 180°C and having the molecular weight of 105. The pyrolysis was carried out in a tubular reactor on a laboratory and semi-industrial scale. High yields of ethylene, propylene, butylenes and divinyl were obtained at 800°C and contact time of 0.5 sec (ethylenic regime), the total yield of unsaturated hydrocarbons reaching 50% of the feed and the content of divinyl in the gaseous products being close to 45%. The liquid condensate has a highly aromatic nature. For the butylenic regime the best conditions are: temperature - 760°C, contact time - 1 sec at 50% steam dilution. The yield of butylenes reaches 645 kg and that of propylene 880 kg per 1 ton of ethylene produced. In addition 1800 kg of liquid condensate is obtained boiling between 47 - 195°C and Card 1/2

Preparation of lower olefines ...

containing more than 50% of compounds capable of being sulphonated. The condensate has the research octane number of 84. The hydrogenated condensate resulting from the ethylenic regime pyrolysis has the "research" octane number of 99. It is concluded that the pyrolysis of benzenes gives a more flexible product distribution than that of n-butane or propane and may be economically advantageous. There is 1 table.

TITLE: Production and motor properties of gasolines from pyrolysis products

SOURCE: Khimiya i tekhnologiya topliv i masel, no. 5, 1964, 23-29

TOPIC TAGS: gasoline, production, motor property, octane number, pyrolysis resin, pyrocondensate, low pressure hydrogenation, high octane gasoline, aluminum cobalt molybdenum catalyst, monoolefin, antidetonation property, octane rating

ABSTRACT: Conditions were developed for the low pressure hydrogenation of fractions of pyrolysis resins and pyrocondensates to obtain high octane gasolines. Pyrolysis resins of the ethylene system and pyrocondensates of the butylene-divinyl system, boiling up to 200°C, were hydrogenated at 10-40 atmospheres at a space velocity of 1.6-8.5 hr⁻¹ in the presence of a technical aluminum-cobalt-molybdenum catalyst using a hydrogen:crude oil volume ratio of 500-800:1. In the hydrogenation of the pyrolysis resins at 40 atm. from 225-300°C it was found that 235°C was optimum: 75% of the dienes were hydrogenated to monoolefins; at higher temperatures the

ACCESSION NR: AP4036979

higher octane number monoolefins were hydrogenated to saturated hydrocarbons. The octane ratings were obtained on 1 cylinder test units IT9-2 and IT9-6 and auto engines MZMA-407. Changing the depth of hydrogenation of the unsaturated hydrocarbons of the highly aromatic distillates of these pyrolysis resins had little effect on the antideetonation properties of the gasolines; these had octane numbers of 86-96 by the motor method and 99-110 by the test unit method. Increasing the depth of hydrogenation of the unsaturated hydrocarbons of gasoline from pyrocondensates having a lower aromatic hydrocarbon content somewhat lowered its antideetonation properties; the octane number was lowered from 78.5 to 75.0 upon complete hydrogenation. It was shown that hydrogenated gasolines from pyrolysis resins of gaseous and liquid hydrocarbons can be used as highoctane components in the production of automobile gasolines. Gasolines A-66 (e.g., from commercial A-56 / 20% hydrogenated gasolines), A-72 (commercial A-66 / 30% hydrogenated gasolines) and A-80 (commercial A-72 / 45% hydrogenated gasolines) have higher antideetonation properties than commercial gasolines bearing these designations. TITLE: Hopper feeder on a forced air installation for transporting loose materials.
Class 31, No. 166600

SOURCE: Byulleten' izobreteniya i tovarnykh znakov, no. 22, 1964, 93-94

TOPIC TAGS: conveying equipment

Translation: This inventor's certificate introduces a hopper feeder for a forced air installation which transports loose materials. The device includes a hopper which feeds the material alternately into two transfer hoppers equipped with feed valves. The material is transported from the transfer hoppers to a mixing chamber where the end of the main pipeline is located. At the end of the pipeline is a movable cone which controls the concentration of the mixture being transported along the line with compressed air. In order to transport the material by gravity feed from the transfer hoppers to the mixer, the transfer hoppers are mounted above the mixing chamber, and the conical dump valves are mounted where they are joined. Minimum Noise Coefficient of
Double-Stream Valve, S. K. Lesota,
~~for 5-electron/EV tracks, Sept. 1950, Vol. 1,~~

No. 9, pp. 1288-1291.) The calculation presented takes into account the correlation of fluctuations of the current and voltage in the double electron stream. A linear approximation and loadless-multipole theory are used. Results show that the minimum noise coefficient is higher for the double-stream valve than for a travelling-wave valve operating under similar conditions for fluctuations in the potential minimum.

AUTHOR: Lesota, S. K.**TITLE:** The Minimum Noise Figure in Travelling-Wave Tubes (O minimal'nom koefitsiyente shuma LBV)**PERIODICAL:** Radiotekhnika i elektronika, 1959, Vol 3, Nr 9, pp. 1193-1198 (USSR)**ABSTRACT:** The noise figure in a travelling-wave tube at a cross-section corresponding to the input of the helix can be written as:

$$F = 1 + \alpha |M_U(\omega) + N_I(\omega)|^2 \quad (1)$$

where $U(\omega)$ and $I(\omega)$ are the noise modulation of the voltage and current in the beam, M and N are the coefficients depending on the excitation conditions of the wave at the input to the helix and the propagation constants of all the waves, and α is the parameter dependent on the DC components of the voltage, current and space charge as well as the thermal noise at the input of the tube. Eq.(1) can be written as Eq.(2) or as Eq.(4) if the notation of Eqs.(3) is adopted; in Eq.(4) Δf is the bandwidth of the measuring device and $\beta = 4\pi\alpha M$. The minimum value of the noise figure is given by Eq.(6); this occurs when ϕ and λ fulfil the conditions expressed by Eqs.(5). Finally,

Card 1/3

SOV/103-3-9/20

The minimum noise figure in Travelling-Wave Tubes
the minimum noise figure can be written as:

$$F - 1 = 2\beta |\operatorname{Re}(\tilde{\alpha}_w^*)| [\beta(\omega) \pm K_w] \quad . \quad (7)$$

It is of interest to determine the form of Eq.(7) when the current and voltage modulations are known at an arbitrary cross-section of the helix instead of its input. The segment of the tube between the two cross-sections can be described by a matrix, as given by Eq.(9), so that the minimum noise figure is given by Eq.(11). If the matrix parameters satisfy the conditions expressed by Eqs.(12) and (15), the first term of Eq.(7) can be expressed by Eq.(15). If it is assumed that the section of the tube has purely passive parameters such that the modulation coefficients are expressed by Eqs.(17), the quadrupole is a "reciprocal" of that defined by Eq.(11) and it has a smoothing effect on the noise figure of the tube. From the analysis it is concluded that the minimum noise figure for the tube depends on

TITLE: On the Methodology of measurement of the Reciprocal Correlation of Amplitude- and Frequency- Fluctuations of a Real Generator According to the Method of Bernshteyn

PERIODICAL: Vestnik Moskovskogo universiteta. Seriya matematiki, mehaniki, astronomii, fiziki, khimii, 1959, Nr 1, pp 109-116 (USSR)

ABSTRACT: The author considers a harmonic generator the oscillations of which with respect to amplitude and phase are modulated randomly

$$(1) \quad v(t) = V_0 [1+m(t)] \sin [\omega_0 t + \varphi(t)],$$

where $\varphi(t) = \int_0^t \omega(t) dt$, $m(t)$ and $\omega(t)$ are random functions

with a stationary distribution, and V denotes the stationary oscillation amplitude. After passage of a line with frequency dispersion and a certain given transfer function, one obtains for the initial signal

$$(10) \quad v_2(t) = V_0 [1+m(t-\tau)] \sin [\omega_0 t - \beta_0^{-1} \varphi(t-\tau)].$$

On the Methodology of Measurement of the
Reciprocal Correlation of Amplitude- and
Frequency- Fluctuations of a Real Generator
According to the Method of Bernshteyn

SOV/55-59-1-13/28

The fluctuations show a delay compared with the phase of the carrier frequency ω_0 . The phenomenon is explained by the fact that the obtained spectral components are certain temporal mean values. The results obtained according to the method of I. L. Bernshteyn [Ref 1] confirm measurements of V. S. Troitskiy [Ref 3] and others.

TITLE: Measurement of the correlation between amplitude and frequency fluctuations in a reflecting klystron

PERIODICAL: Vestnik Moskovskogo universiteta, Seriya 3, fizika, astronomiya,¹⁶ no. 2, 1961, 3 - 8

TEXT: The correlation between amplitude and frequency fluctuations in a reflecting klystron was studied by I.L. Bershteyn's interference method of measuring amplitude and frequency fluctuations in radio-frequency generators. The measurements were made in a wavelength range of 3.4 cm. A waveguide about 17 m long was used as delay line in the measuring arrangement. The fluctuation signal of the klystron generator investigated was received by a crystal detector (rectifier) with a constant current of 6.4 ma. The correlation function $R(\tau)$ can be determined from the spectral density $S_{\omega_m}(\omega)$ of the intercorrelation functions of amplitude and frequency fluctuations; $R(\tau) = \frac{1}{2\pi} \int S_{\omega_m}(\omega) \cos \omega \tau d\omega$. The normalized correlation

Measurement of the correlation ...

function $R_n(\tau)$ is determined from the relation $R_n(\tau) = R(\tau)|R(0)$. The results of measurement showed that for $\tau \leq 1 \div 3 \cdot 10^{-8}$ sec a correlation existed which decreased substantially with increasing τ . The measured values of the spectral density corresponded to a relative generation power of $p \approx 0.6$ and to a relative voltage $\Delta V/V \approx 0.1$ on the klystron reflector; at $p = 1$, the voltage on the reflector was V_0 , and the generation power for the given generation range was at a maximum. The author also studied the behavior of the correlation function on a change in voltage on the klystron reflector within the limits of the individual generation ranges. Measurements for some voltage values on the reflector within the limits of the generation range showed that the absolute spectral density of the correlation function increased at the boundaries of the generation range. The spectral density $S_{\omega n}(\omega)$, however, changes its sign when passing through the middle of the range. The author observed a similar dependence for the correlation function $R(\tau)$ on a change in the reflector voltage. The mean correlation time was of the order of 10^{-8} sec. There are 8 fig-

TITLE: Experimental investigation of fluctuations in a reflex klystron 9M

SOURCE: Moscow. Universitet. Vestnik. Seriya 3. Fizika, astronomiya, no. 6, 1964
25-35

TOPIC TAGS: klystron oscillation, reflex klystron, oscillation fluctuation, electron velocity, spectral density, cross modulation

ABSTRACT: The paper deals with fluctuations of the oscillations of low-power klystrons in the 3-cm wavelength range, under various operating conditions. Previous work by the present and other authors has provided data only at isolated points of the frequency range and has not aided evaluation of the effect of electron velocity spread on fluctuations in oscillation. Measurements were conducted as a function of current (two-fold increase), voltage on the reflector (decrease to 1/3 center power) and for the ends and center of mechanical tuning adjustment of frequency. Fluctuations were measured by the delay-line method for the frequency range 0.15 to 18 Mc. The spectral density, r.m.s. amplitudes and frequencies, cross-modulation for 0-20 Mc and the mean time of cross-correlation

Card 1/2

L 25695-65
